                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence encodes a human odorant binding polypeptide (OBP), designated OBPIRa-alpha. OBPs provide long-team retention (gradual release) of lipophilic compounds, so prolong the 'hold' of perfumes, deodorants etc. OBP polypeptides are used as binding proteins for hydrophobic lipands (particularly odorants); as competitive inhibitors of generical procedural procedural proteins for hydrophobic lipands (particularly odorants); as competitive inhibitors of specific antibodies for diagnosis of allergy, astuma or cancer, for controlling volatilisation of an odorant, specifically in perfumes, cosmetics or disinfectant compositions; to screen compounds, especially dorants or flavours, e.g. human pheromones, for binding to OBP, also in analysis of complex perfume mixtures; to solubilise lipophilic compounds; or treating hyperlipidemia or obesity, or to supplement non-maternal milk when combined with nutritional fatty acids, as food additives; as a transporter of pharmaceuticals, especially anticancer agents (providing delayed release) but also for delivery accors the placental barrier (e.g. for detoxification of the foetus); as a marker of pregnancy or foeture necestal partier controlling controlli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Odorant binding polypeptide; OBP; hydrophobic ligand; odorant; allergy; asthma, cancer; perfume; hyperligidenia; obseity; food additive; anticancer; foetus detexification; pregnancy marker; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New human odorant-binding proteins, useful for solubilising lipophilic compounds in the transportation of anticancer agents or for slow release of perfumes

OBPS provide long-team retention (gradual crelesse) of lipophilic compounds, so prolong the 'hold' of perfumes, deodorants etc. OBP polypeptides are used as binding proteins for thydropholic ligands (particularly odorants), as competitive inhibitors (agonists or antagonists) of cellular lipocalcin receptors; to detect to specific antibodies for diagnosis of allergy, asthma or cancer; for controlling volatilisation of an odorant, specifically in perfumes, commetics or disinfectant compositions; to screen compounds, especially compounds or flavours, e.g. human pheromones, for binding to OBP, also malysis of complex perfume mixtures; to solubilise lipophilic compound; maly when complement or obesity, or to supplement non-maternal milk when combined with nutritional fatty acids, as food additives; as a transporter of pharmaceuticals, especially anticancer agents (providing tealse) but also for delivery across the placental barrier of delivery electrolians and as marker of pregnancy or feetor-placental pathology (rupture of the amnototic membrane); and as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1;

release) of lipophilic compounds, so prolong the 'hold' of perfumes, considerate stc.. OBP polypeptides are used as binding proteins for hydrophobic ligands (particularly odorants); as competitive inhibitors (agonists or antagonists) of cellular lipocalcin receptors; to detect controlling volatilisation of an odorant, specifically in perfumes, cosmetics or distinfectant compositions; to screen compounds, especially conntrolling volatilisation of an odorant, specifically in perfumes, cosmetics or distinfectant compositions; to screen compounds, especially controlling volatilisation of selections; to supplement non-maternal analysis of complex perfume mixtures; to solubilise lipophilic compounds; for treating hyperlipidemia or obesity, or to supplement non-maternal control compounds and with mutritional fatty acids, as food additives; as a transporter of pharmaceuticals, especially anticancer agents (providing delayed release) but also for delivery across the placental barrier content pathology (rupture of the amnibitic membrane); and as antiallergic agents.

The invention relates to isolated polynucleotide (I) and purpertied (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome of gene mapping, and in recombinant production of (II). The polymetides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques (I) is useful in gene therapy techniques (I). (II) is useful in gene therapy techniques (I). (II) is useful in gene therapy techniques (I). (II) is useful in gene therapy techniques (II). (II) and its binding partners are useful in medical and food supplement. (II) and its binding partners are useful in medical inapping of sites expressing (II). (I) and (II) are useful in reating (II) chartification of insological activity. The polypeptide and polynucleotide sequences have applications in the printed and to produce other types of deta and products dependent on DNA and diagnostic coding sequences of the invention.

Consideration, but was obtained in electronic format directly from Wipo at the printed the theorem in the printed at the pain the printed at the pain in the printed at the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              45 ATGAAGACCCTGTTCCTGGGTGTCACGCTCGGCCTGGCCGCTGCCCTGTCCTTTCACCCTG 104

The present sequence encodes a human odorant binding polypeptide (OBP), designated OBPID-beta (long form). OBPs provide long-term retention (gradual release) of lipophilic compounds, so prolong the 'hold' of cradual release) of lipophilic compounds, so prolong the 'hold' of perfumes, deodorants etc.. OBP polypeptides are used as binding proteins for hydrophobic ligands (particularly doctants); as competitive compositions or anisation of an odorants, psecifically respectives, to detect specific antibodies for diagnosis of allergy, asthma or cancer; for controlling volatilisation of an odorant, specifically in perfumes, comments or disinfectant compositions; to screen compounds, especially docarants or flavours, e.g. human pheromones, for binding to OBP, also in analysis of complex perfume mixtures; to solubilise lipophilic compounds; for treating hyperlipidemia or obesity, or to supplement non-maternal milk when combined with nutritional fatty acids, as food additives; as a controlling calculation of the foetual; as a marker of pregnancy or closto-placemtal pathology (rupture of the amniotic membrane); and as antiallergic agents.
New human odorant-binding proteins, useful for solubilising lipophilic compounds in the transportation of anticancer agents or for slow release of perfumes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 GGTGTCACGCTCGGCCCTGCCCTGTCCTTCACCCTGGAGGAGGAGGATATCACA 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAK7937-AAK9303) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating

Equal amounts of plasmid DNA from three normalized libraries (fetal lung NBL139W, restis NRT, and B-cell NVI_CGAP_CGNI) were mixed, and ss circles were made in vitro. Following RAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687339, T26468-728711, and 729056-731399. Subtraction by Bento Soares and M. Fatima Bonaldo. I others

        :
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Double-stranded cDNA was ligated to Bco RI adaptors

(Pharmacia), digested with Not I and cloned into the Not I
and Bco RI sites of the modified pr773 vector. Library
went through one round of normalization to Cot5, and was
constructed by Bento Soares and M. Fatima Bonaldo. "

/note="Organ: uterus; Vector: pT773D-Pac (Pharmacia) with a modified PoJ1inker; 1st strand cDNs was prepared from pregnant mouse uterus, and was then primed with a Not I oligo(dT) primer. Double-stranded cDNs was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT73 vector. Library is normalized. Library was constructed by Bento Scares and M. Fatima Bonalo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          R47029 15-MAY-1995 15-MAY-1995 15-MAY-1995 15-MAY-1995 15-MAY-1995 Nat incisor (noncalcified tissues) Rattus norvegicus CDNA clone 1358 5' end similar to odorant-binding protein (RYZG12), mRNA

Xho I; The apical portion and the entire pulp of the
maxillary and mandibular incisors from 3-4 week old rats
were excised. A cDNA library was constructed in the liap
II vector (Stratagene) by use of poly A+ RNA from these
tissues. The phage cDNA library was converted into a
Bluescript phagemid cDNA library by in vivo excision by
the Exassist/Solm system (Stratagene).
